Logmar Illuminated Tasks

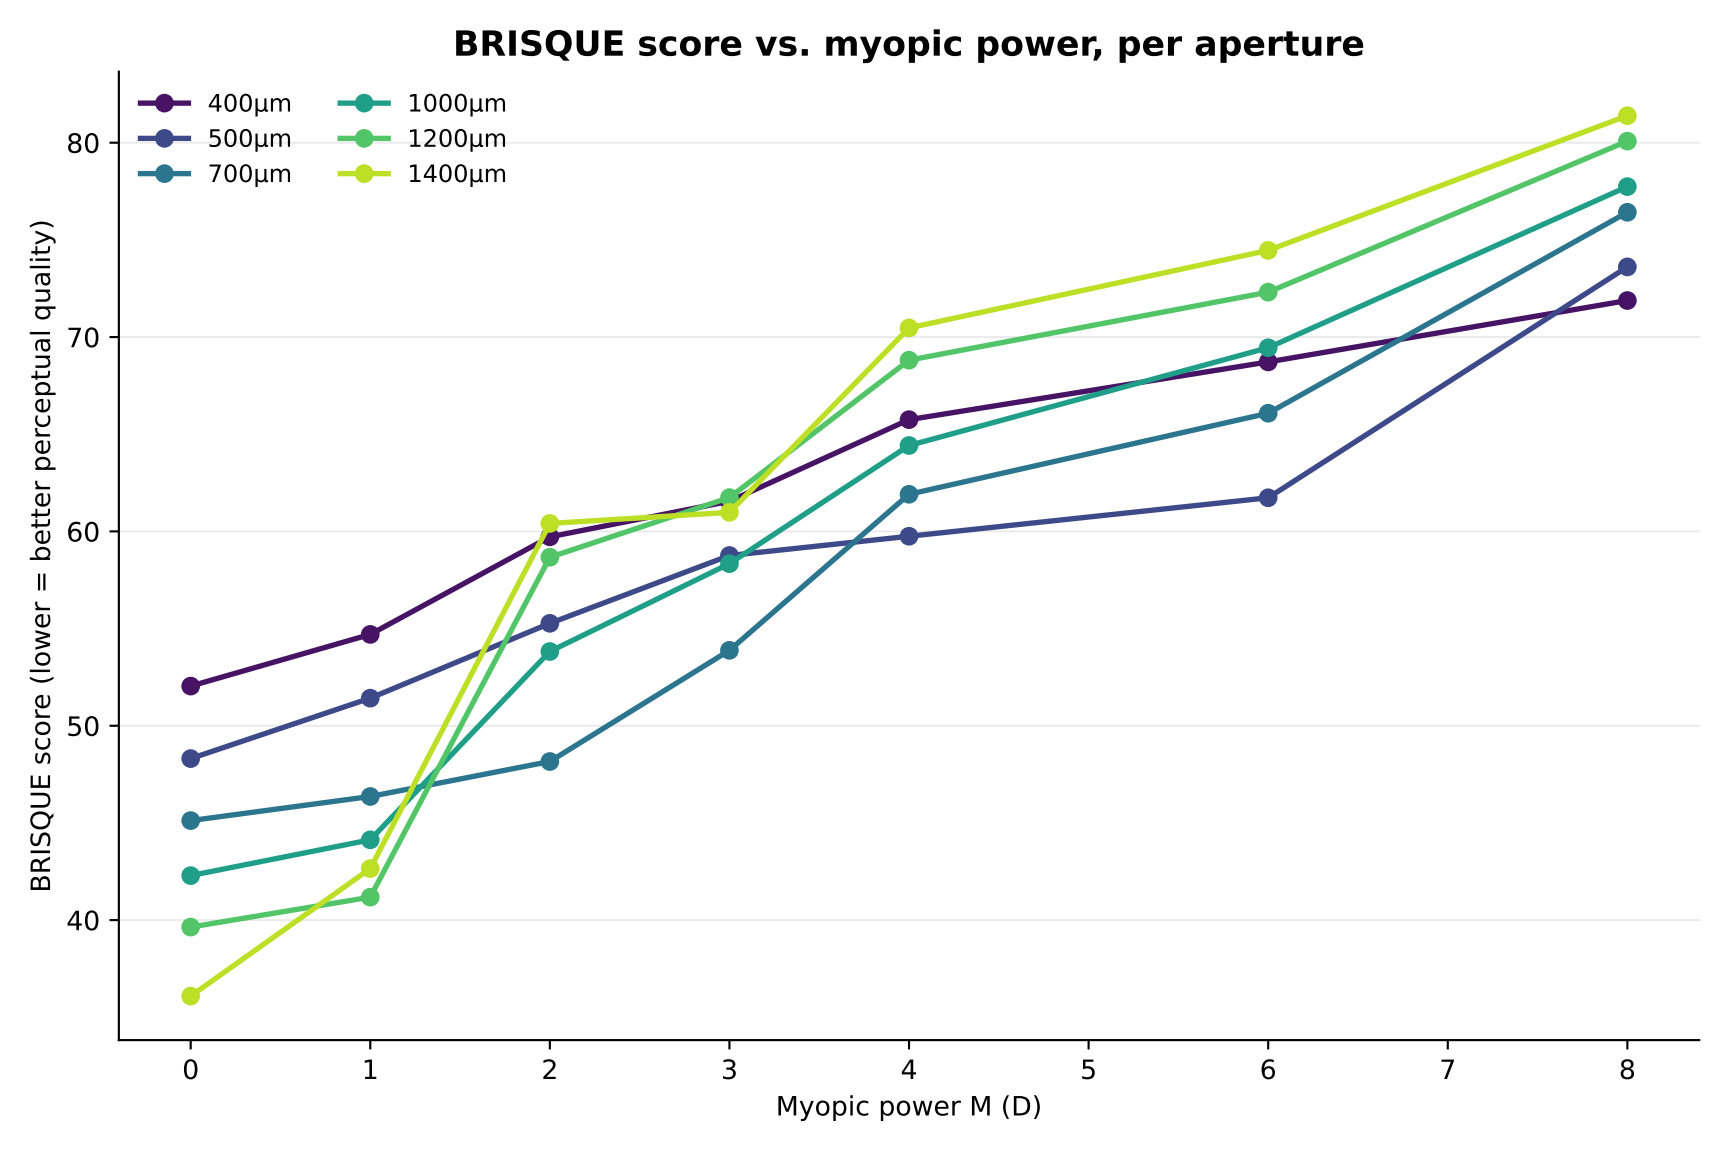

BRISQUE No-Reference Image Quality -- Heatmaps, Graphs, Tables

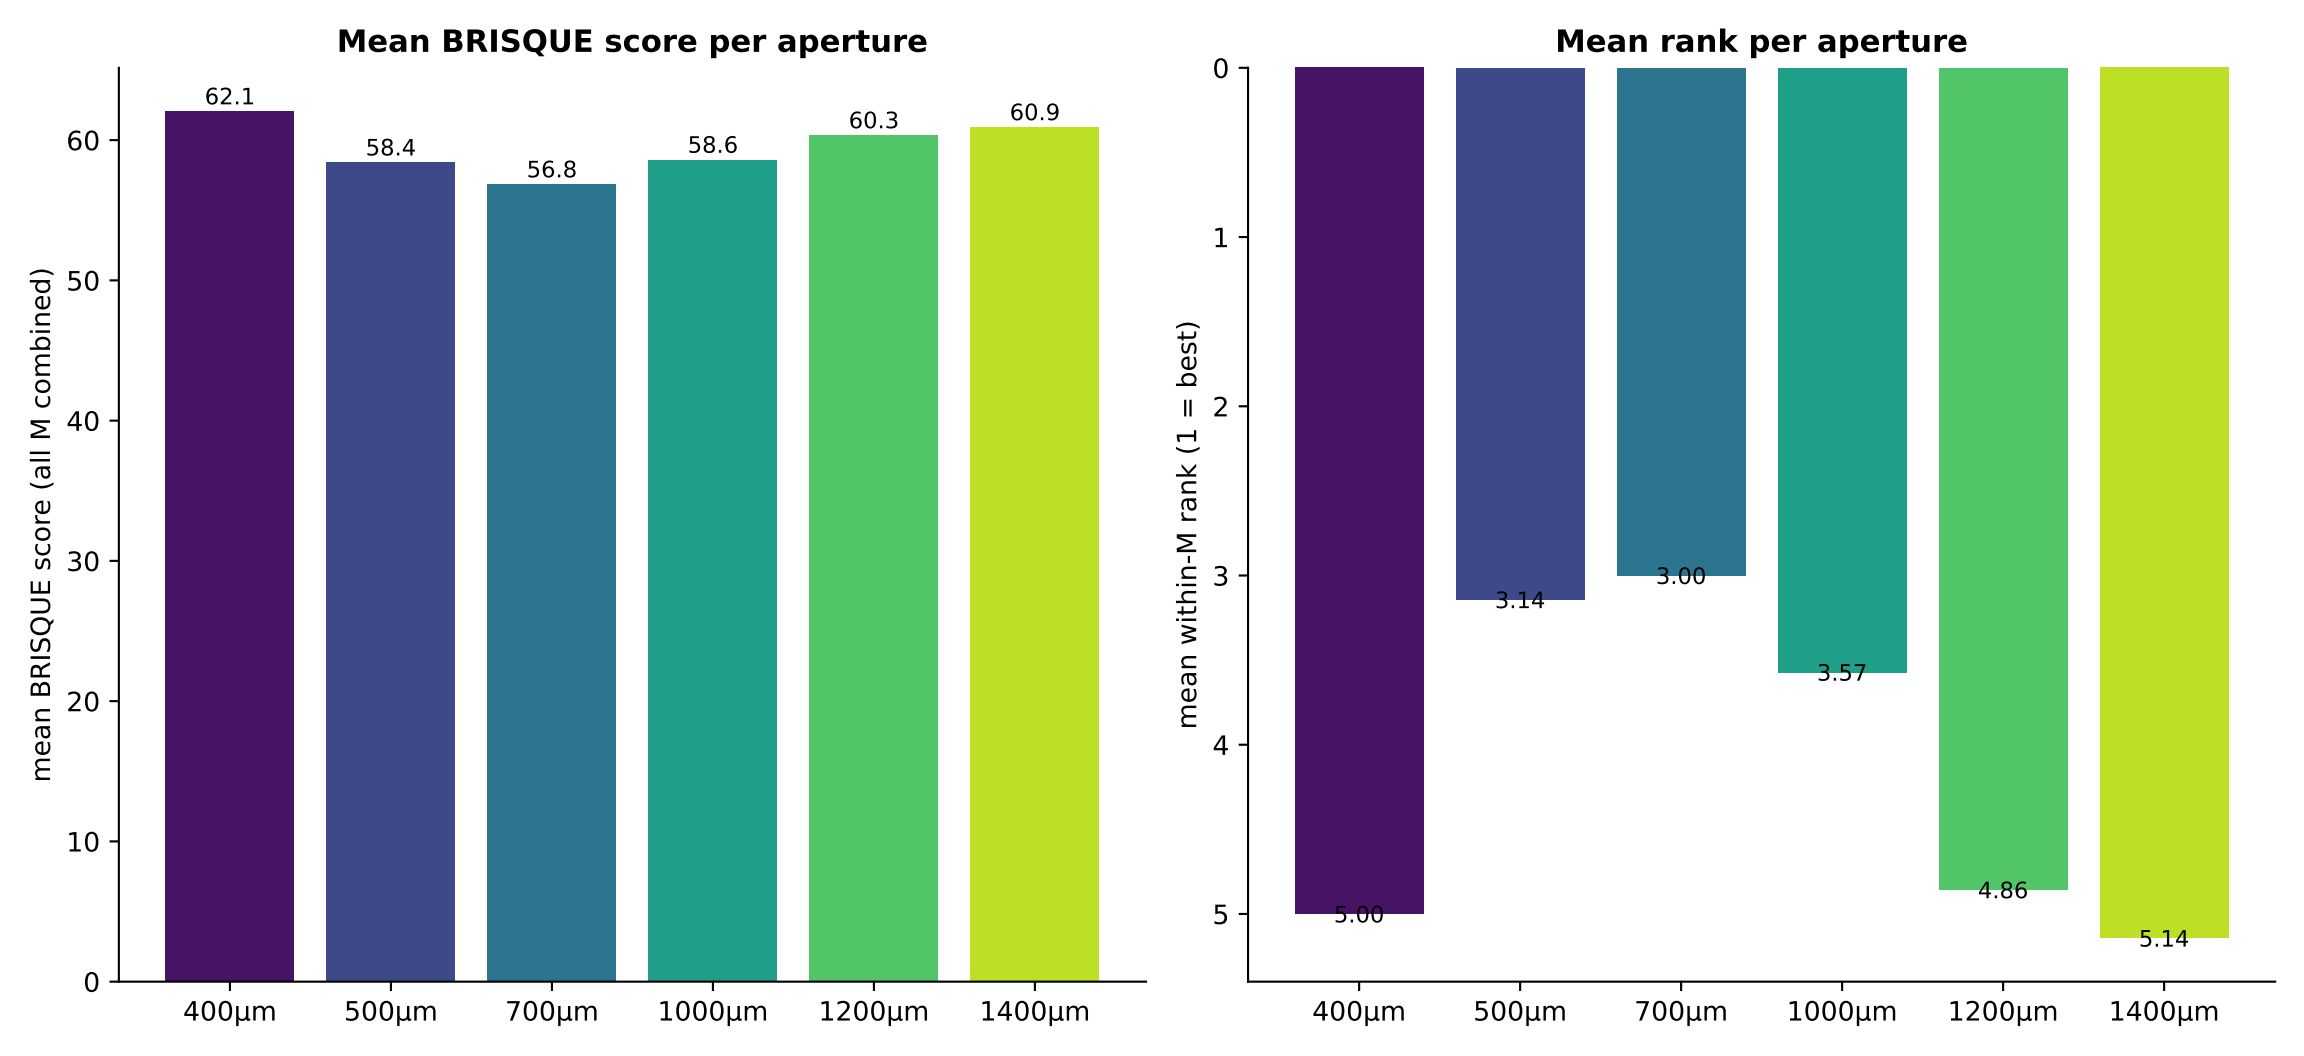

Source: user-supplied Logmar_Illuminated_tasks.xlsx (uploaded 2026-09-14).
NOTE: these BRISQUE values differ from this project's own earlier run_brisque.py output on the same ExP1 folders (generated 2026-09-09/10) -- treated here as an independent source, not reconciled or merged.

Per request: the no-pinhole control series and the M=5D row (only the 500um aperture had a data point at M=5D) are EXCLUDED from this version. Rank values shown are exactly as given in the source file -- originally computed across all 7 entries per M (6 apertures + control); with the control row now removed from view, the visible ranks for the 6 remaining apertures may not form a clean 1-6 sequence (a gap marks the control's original rank slot) -- not renumbered/recomputed, shown as-is.

BRISQUE score -- aperture x myopic power (lower = better)
